                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is from the Herpes simplex virus (HSV) type I strain Patton and encodes a glycoprotein B. HSV is a double stranded virus packaged within an icosohedral nucleocapsid enveloped within a membrane. The membrane includes a number of virus-specific glycoproteins, with glycoprotein B being one of the most abundant. Glycoprotein B from both HSV type I and type II are cross reactive. New vaccines comprising recombinantly produced glycosylated glycoprotein B that has a deletion of at least part of the transmembrane anchor region, in combination with a carrier and an adjuvant have been produced. The vaccines are used for immunising humans against HSV (HSV type 1 or HSV type 2) by vaccination before or after primary infection with HSV.
                                                                                                                                                                                                               Sequence of Herpes simplex virus (HSV) glycoprotein B (gB) 1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 3471 BP; 639 A; 1201 C; 1069 G;

The amino acid sequence and DNA sequence for gB 1 presented in AAP80914 and AAN80907 differ from that originally presented in Table 1 of International Publication No. WO 85/04587. The DNA sequence in Table 1 contains an error in that an additional nucleotide (G) is listed at position 607 which resulted in a shift in reading frame relative to AAN80907 from which this nucleotide has been deleted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine for treatment of herpes simplex virus - recombinant HSV glyco:proteins B and D

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PATENT NO. 6551795
GENERAL INFORMATION:
APPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
    COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/076,726
FILING DATE: 14-UN-1993
CLASSIFICATION: 435
ATTORNEY/AGENT INFORMATION:
NAME: Esmond, Robert W.

Site_l: Ecori Site_2: Xhoi; Seeds were surface-sterilized
seedlinated and grown aseptically in the dark at room
temperature on filter paper with water, nystatin and
cefotaxime in covered crystallization dishes. Five-day
old seedlings were transferred to 5 Coold room and kept
for 48 hr. The tissue, total RNA, and poly(A) RNA were
prepared, a cDNA library was made, and the cDNA clones
were in vivo excised to give pBluescript phagemids in the
TU Close lab (Choi, Close, Fenton) at the University of
California, Riverside. Plasmid DNA preparations and DNA
sequencing were performed in the OD Anderson lab (all

Original source text: HSV1 strain tsB5 DNA, clone pTBG-BS1. HSV1 strain tsB5 is a mutant of strain HFEM that is temperature dependent for virus growth, production of gB, and fusion of Vero and HEL cells. The syn and ts lesions of tsB5 are separable by recombination, the syn defect being located between 0.345 and 0.355 map units, and the ts defect being located between 0.360 and 0.368 map units. The rate of entry determinant of tsB5 is genetically separable from both the syn and ts lesions and is located between 0.350 and 0.360 map units, which is entirely within the glycoprotein B gene (0.348 to 0.366 map units).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GenBank staff at the National Library of Medicine created entry (NCBI gibbsq 137392) from the original journal articities sequence comes from Fig. 7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Stain t8B5 has a total of 12 base substitutions within the coding region for gB when compared to strain KOS. Of these, only two cause amino acid substitutions; a 't' to'c' transition at bp 695 causes a Val to Ala substitution, and a 'g' to 'a' transition at bp 1610 causes an Arg to His substitution. Because the rate-of-entry determinant has been mapped to between 0.350 and 0.360 map units, the transition at bp 695 must be responsible for the difference in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Patent: JP 1991218397-A 2 25-SEP-1991;
